GRANNY

A data bank of chemical analyses of Laramide and younger
high-silica rhyolites and granites from Colorado
and north-central New Mexico

Celia H. Steigerwald, Felix E. Mutschler, and Steve Ludington

ABSTRACT

GRANNY is a data bank containing information on 507 chemically analyzed Laramide or younger high-silica rhyolites and granites from Colorado and north-central New Mexico. The data were compiled from both published and unpublished sources. The data bank is designed to aid in the recognition of igneous rocks with a high exploration potential for the discovery of molybdenum (and other lithophile element) deposits. Information on source reference, geographic location, age, mineralogic and petrologic characteristics, major constituent analyses, and trace element analyses for each sample are given. The data bank is available in two formats: (1) paper- or microfiche-hardcopy, and (2) fixed format computer readable magnetic tape.

INTRODUCTION

GRANNY is a computer-readable data bank consisting of descriptive and chemical data for 507 rock specimens for which major constituent chemical analyses are available. The analyses were largely compiled from published works and theses, available either on microfilm or through inter-library loan services. Several colleagues made unpublished chemical analyses available to us, and these, together with our own unpublished analyses, were also included in the data bank.

The three 1/ granite (or Climax-type) molybdenite deposits which are currently being mined in the United States occur within the area of our compilation. The source rocks for these deposits are high-silica low-calcium rhyolites and granites (Mutschler and others, 1981; White and others, 1981). Our compilation began as an attempt to assemble all the available petrochemical data for these deposits, and for the many granite molybdenite system prospects in Colorado. We then decided to broaden the data bank to include all Laramide and younger high-silica rhyolites and granites in Colorado for which chemical data were available. Our aim was to produce a data bank that would help in the development of "chemical fingerprints" for the recognition of high-silica rhyolites and granites with a high exploration potential for the discovery of Mo (and other lithophile elements such as Be, Sn, U, and W) deposits in Colorado.

For inclusion in the data bank we have defined high-silica rhyolites and granites as those igneous rocks containing at least 70.0 weight percent SiO₂. We have also included 33 analyses with less than 70.0 weight percent SiO₂ where those analyses represent rocks which are clearly related to granite molybdenite deposits or prospects.

We have tried to structure GRANNY so that it can be interfaced with other petrochemical data banks such as CLAIR (Le Maitre, 1973), IGBA (Hayes and Mutschler, 1978), PETROS (Mutschler and others, 1981), and RASS (U. S. Geological Survey, 1983). This, we hope, will allow the petrologist and explorationist to rapidly test models based on the Colorado data in other areas.

ACKNOWLEDGMENTS

We thank Siegfried Heintze for help with programming and tape production. Denise Rougon-Mutschler proofread GRANNY. Dolores Gable, W. E. Hall, D. A. Johnson, R.

Priestley Toulmin, Ogden Tweto, and R. A. Zielinski
graciously made unpublished analyses available to us.

DESCRIPTION OF GRANNY

GRANNY is available in two formats: (1) hardcopy, either as paper- or microfiche-copy of computer printout; and (2) computer-readable magnetic tape.

The same information is contained in both formats except that on the hardcopy version some information which is stored in code on the tape version is printed as the corresponding English literals. For example, the mineral name "quartz" is stored on the tape version as "UM", but is printed out as "QUARTZ" on the hardcopy.

The analyses in the hardcopy version of GRANNY are arranged by major groups and by secondary groups as explained below. Major groups are arranged in alphabetic order and secondary groups for each major group are arranged in the order listed on Table 1.

On the tape version of GRANNY analyses are arranged sequentially by record number (see below), in the order in which they were entered into the data bank. Tape characteristics are listed on page 35.

The following two sections are addressed to different audiences. The section, "Variable descriptions" tells the petrologist-user what information is stored in GRANNY. The section "Tape description, data formats, coding form, and program listings" is directed to computer programmers and data managers who will be responsible for loading the data bank into a computer and interfacing it with system- or user-supplied software.

Variable descriptions

Values for up to 106 variables may be stored for each analyzed specimen. Each analysis must have values for the variables AUTHOR, DATE, MAJOR GROUP, ROCK CODE, RECORD NUMBER, and at least eight of the MAJOR CONSTITUENTS: SiO₂, Al₂O₃, Fe₂O₃, FeO, MgO, CaO, Na₂O, K₂O, H₂O, H₂O-, TH₂O, TiO₂, P₂O₅, and MnO.

The variables are described below and are listed on Table 5.

AUTHOR:

Surname of author. Multiple authors are indicated by a plus sign (+) following the senior author's name. Complete citations for all references and unpublished data are given in Table 1.

DATE:

Year of publication, or year of inclusion in data bank
for unpublished analyses.

MAJOR GROUP:

The analytical data are divided into 15 major groups which represent geographic areas. A three character alphabetic code is used for each major group. Table 1 contains a listing of the major group codes. The areas represented by the major group codes are shown on Figure 1.

SECONDARY GROUP:

Major groups may be subdivided into secondary groups (abbreviated SECOND GROUP on the printout). Secondary groups represent geographic location, or stratigraphic unit subdivisions. A two- to four-character alphabetic code is used to designate each secondary group. These codes are listed in Table 1. Even if a major group is divided into secondary groups not all analyses in that major group need have secondary group codes. On the printout analyses not assigned to a secondary group are listed last under each major group.

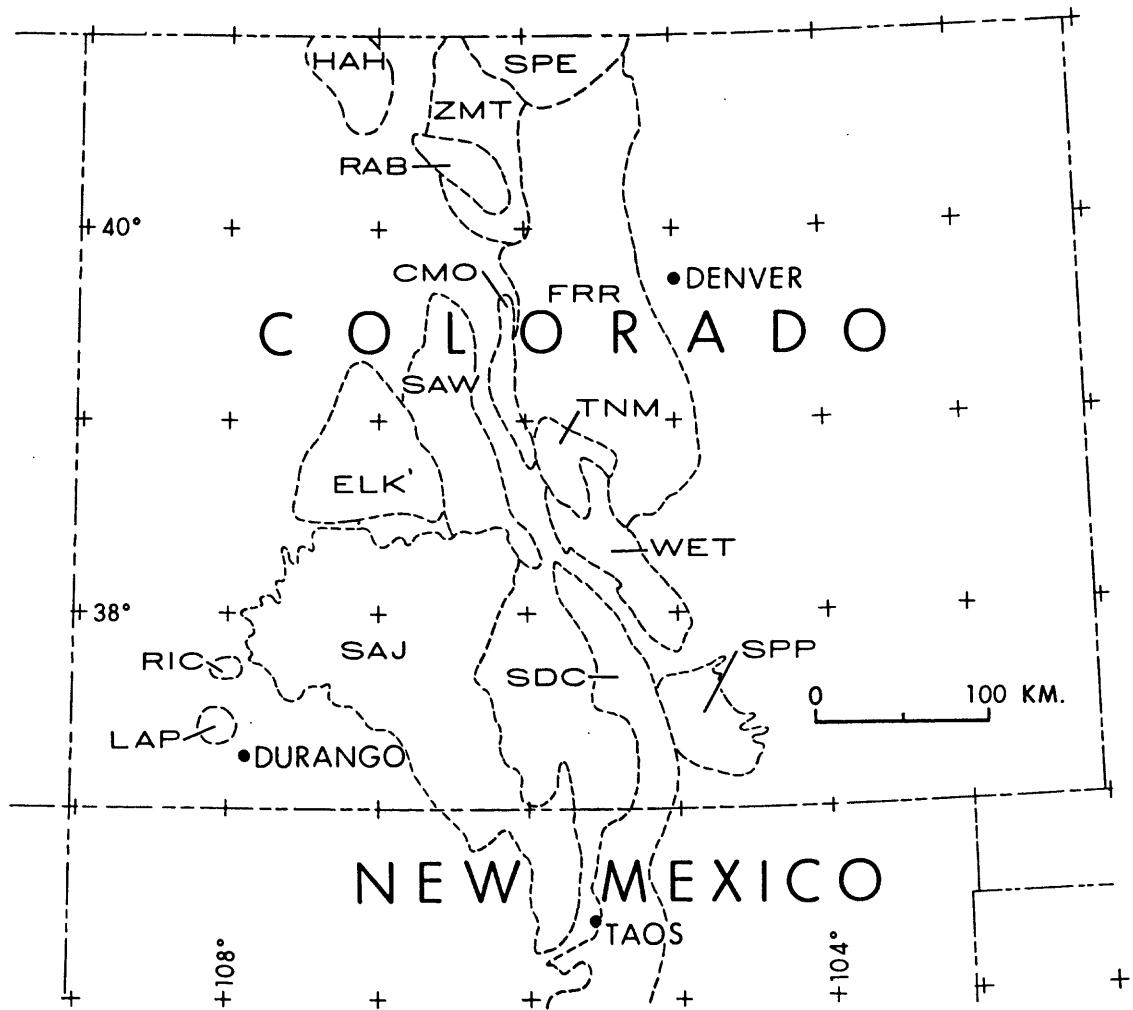

Figure 1 -- Index map showing areas represented by major group codes.

SOURCES OF ANALYSES

Izett, G. A., 1968, Geology of the Hot Sulphur Springs quadrangle, Grand County, Colorado: U. S. Geological Survey Professional Paper 586, 79 p.

Izett, G. A., Denson, N. M., and Obradovich, J. D., 1970, K-Ar age of the lower part of the Browns Park Formation, northwestern Colorado: U. S. Geological Survey Professional Paper 700-C, p. C150-C152.

LATITUDE:

Latitude (abbreviated LAT on the printout) of the sample location to the nearest one-hundredth part of a decimal degree, followed by an "N" for north.

LONGITUDE:

Longitude (abbreviated LONG on the printout) of the sample location to the nearest one-hundredth part of a decimal degree, followed by a "W" for west.

FLAGS:

Flags give information on the nature of the analytical data. Up to six flags may be stored for each analysis, but a maximum of two are used in this version of GRANNY. Each flag consists of two characters as shown below:

INFORMATION	FLAG
Total iron is reported as either Fe2O3 or FeO	2D
Analytical data represents an average of analyses of two or more specimens	3K

ROCK NAME -- CODE:

ROCK NAME is the name assigned to the analyzed specimen by the author. It is recorded by a literal name, and consists of up to 20 alphabetic characters. CODE consists of a four integer number which may be translated as shown on Table 2, and which represents the literal name stored in ROCK NAME.

Table 2. -- Rock names and codes.

ROCK NAME -----	CODE ----
NOT NAMED BY AUTHOR	0010
NAME NOT RECOGNIZED IN GRANNY	0020
ALASKITE	0080
ANDESITE	0190
APHANITE	0280
APLITE	0290
BOSTONITE	0750
FELSITE	1240
GLASS	1390
GRANITE	1420
GRANODIORITE	1490
MICROGRANITE	1440
MONZONITE	2310
NEVADITE	2400
OBSIDIAN	2500
PERLITE	2730
PITCHSTONE	2830

QUARTZ MONZONITE	2330
QUARTZ PORPHYRY	2890
RHYODACITE	3000
RHYOLITE	3010
SODA GRANITE	1470
SYENITE	3350
TUFF	3880
VITROPHYRE	4000
WELDED TUFF	4060

AGE:

Both minimum and maximum values for stratigraphic and isotopic ages may be given for a sample. The method for determining ages may be specified. AGE: STRATIGRAPHIC: Minimum (MIN) and maximum (MAX) limits may be given with four character codes from the following list.

Age	m.y.	Code
---	----	----
Cenozoic	0-65	CENO
Pliocene	2-5	PLIO
Miocene	5-23	MIOC
Oligocene	23-38	OLIG
Eocene	38-53	EOCE
Paleocene	53-65	PALC
Cretaceous	65-135	CRET

Each code is followed by two blank characters. These were left for insertion of modifiers if the user desires.

AGE: ISOTOPIC: Six-digit minimum (MIN) and maximum (MAX) ages may be given in m.y. Two decimal places are provided for.

AGE: METHOD: A code of up to four characters may be used to designate the age determination method. The current version of GRANNY uses the following codes.

Method	Code
-----	-----
Potassium-argon	KAR
Fission track	FSTR

NUMBER OF MINERALS:

This field contains the number of mineral names coded for the specimen (see below). It is not included on the printout.

MINERALS:

Up to ten codes for rock-forming minerals occurring in the analyzed sample may be included here. The first two characters of each code represent the mineral name as shown on Table 3. The third through fifth characters refer to the habit of the mineral. Only one of these habit codes is used in this version of GRANNY (see Table 3).

The print program translates the codes stored in the data bank back into mineral names on the printout.

Table 3. -- Mineral names and codes.

OCCURRENCE AND PETROGRAPHY:

Mode of occurrence and petrographic descriptors (abbreviated OCCUR-PETROG. on printout) are listed by up to six codes for each specimen. The occurrence is always listed first. The occurrence and petrographic descriptor codes are listed in Table 4. The print program translates the codes back into their literal names on the printout.

Table 4. -- Occurrence and petrographic descriptor codes.

OCCURRENCE	CODE
ASH FLOW	AE
BRECCIA	AJ
DIKE	AM
DOME	AN
FLOW	AP
FLOW BRECCIA	AQ
LACCOLITH	AW
PIPE	BI
PLUG	BJ
PLUTON	BK
PYROCLASTIC	BN
SILL	BS
STOCK	BU
TUFF	BZ
WELDED TUFF	CE

PETROGRAPHIC DESCRIPTOR	CODE
APLITIC	DU
DEVITRIFIED	DZ
EQUIGRANULAR	ED
GLASSY	EH
HOLOHYALINE	EQ
PORPHYRITIC	FP
PUMICEOUS	FQ
VITROPHYRIC	GC

ALTERATION:

Up to four codes may be used to describe alteration assemblages. Each code consists of a one or two character code, which may be suffixed with an additional character to indicate alteration intensity. The codes are listed below. The print program translates the codes into English on the printout.

ALTERATION ASSEMBLAGE	CODE
FRESH	F
ALTERED (Assemblage not specified)	IC
ALUNITIC	AL
ARGILLIC	AR
POTASSIC	K
QUARTZ-MAGNETITE	QM
QUARTZ-SERICITE	QS
SILICIFICATION	SI

INTENSITY SUFFIX (PRINTOUT)	CODE
WEAK (-W)	W
MODERATE (-M)	M
STRONG (-S)	S
EXTREME (-X)	X

AUTHOR NUMBER:

AUTHOR NUMBER is the author's sample number or the page (P.) or table (T.) on which the analysis is given in the source. Up to ten characters.

RECORD NUMBER:

Each analysis was assigned a sequential five-digit record number when it was entered into the data bank. This version of GRANNY contains 507 records.

MAJOR CONSTITUENTS:

Weight percentages of up to 26 constituents may be stored for each analysis. The constituents are given in the following order: SiO₂, Al₂O₃, Fe₂O₃, FeO, MgO, CaO, Na₂O, K₂O, H₂O+, H₂O-, TH₂O (Total H₂O), LOI (Loss on ignition), TiO₂, P₂O₅, MnO, ZrO₂, CO₂, SO₃, Cl, F, S, Cr₂O₃, NiO, BaO, Rb₂O, SrO. Major constituent values generally have two decimal places except for TiO₂, P₂O₅, MnO, Cl, F, S, Cr₂O₃, BaO, Rb₂O, and SrO which have three decimal places. A less than sign (<) preceding the CO₂ value indicates less than the value shown.

TOTAL:

This is a computer generated sum of the major constituents.

TRACE ELEMENTS:

Values for up to 37 trace elements may be stored for each sample. The trace elements are given in the order listed below: Ag, As, Au, B, Ba, Be, Bi, Ce, Co, Cr, Cu, F, Ga, Hg, La, Li, Mo, Nb, Nd, Ni, Pb, Rb, Sb, Sc, Sn, Sr, Ta, Te, Th, Tl, U, V, W, Y, Yb, Zn, and Zr.

All values are in parts per million (ppm) except for Au, Hg, and Te which are in parts per billion (ppb). A less than sign (<) before any trace element value indicates less than the amount shown.

Each trace element is stored as up to seven numeric characters with two decimal places. Trailing zeros to the right of the decimal point should be ignored.

Tape description, data formats, coding

form, and program listings

The tape is 9 track, 1600 BPI, ASCII character set. The tape is unlabeled, and contains two files, MOL.TEXT;1 and MOL.DAT;1. Data is blocked at 1214 characters per block. There are 2 records per 1214 character block.

File MOL.TEXT;1 is documentation for GRANNY. Records are fixed format and are 80 characters long.

File MOL.DAT;1 is the GRANNY data base. Records are fixed format and 607 characters long. The petrologist-user will recognize 106 variables per record. Table 5 lists the variable names and their formats.

The GRANNY data bank was built on a VAX 11/780 using DATATRIEVE-11-VERSION V02.04, the DEC query and report writing system. Table 6 gives listings of the DATATRIEVE domain and record definitions for inputting GRANNY records, DATATRIEVE procedures for printing records, and DATATRIEVE description tables.

Table 7 is a coding form which may be used for inputting additional data into GRANNY.

APPENDIX

DATA BANK

GRANNY

HARDCOPY VERSION

Major constituents given in weight percent. Trace element values in parts per million (ppm) except for Au*, Hg*, and Te* which are in parts per billion (ppb).

CO₂ and all trace elements may be preceded by a less than sign (<) indicating less than the amount shown.
